INSTALLATION INSTRUCTIONS
FOR SHORTPACK COOL

REFRIGERATION CAPACITIES:
R-134a  1.8 lbs.
R-12    2.0 lbs.

LUBRICANT CAPACITIES:
NEW COMPRESSOR - NO ADDITIONAL OIL NEEDED
USED COMPRESSOR - CONSULT VINTAGE AIR
INSTALLATION INSTRUCTIONS
SHORTPACK COOL UNIT

The Vintage Air "Shortpack" Cool System was designed especially for your street rod. It will fit neatly behind the dash of your car out of sight. Read the directions completely and remove all parts from box, to identify each of them with packing list.

The installation of this unit varies according to the body manufacturer or modifications to original body. The cowl vent may remain operational. (See step 2 below). Take your time, double check before drilling or cutting.

THE EVAPORATOR WAS DESIGNED TO FIT ON THE PASSENGER SIDE.

1. Check for and fill in any holes in the firewall and floor. Insulate and seal firewall, floor, door panels and head liner to reduce the amount of heat entering into the car.

2. The evaporator should fit as figure 1 shows. Drain outlet is on bottom (down) side of evaporator. The evaporator drain must remain on the bottom of the unit. (Figure 1) If you need to relocate the drain, contact Vintage Air for instructions.

FIGURE 1

KICK PANEL VENT INSTALLATION

LOUVER DRIVER SIDE

CONTROL PANEL

LOUVER PASSENGER SIDE
3. Brackets are furnished to mount the evaporator case. (Attach to firewall as shown in figure 2).

4. When fitting evaporator:
   A. Attach front and rear brackets to the evaporator using 1/4 X 20 X 1/2" bolts.
   B. Fit refrigeration fittings with hoses for proper clearance inside the car. (Refer to hose routing instructions.)

5. Have a helper hold the unit up as high as possible, locate the bracket on the top right side of the blower housing. Drill thru the 1/4" hole in the bracket to mark the firewall. Check to see if the location you marked looks correct and will clear obstructions on both sides of the firewall. If so, drill 1/4" hole in the firewall. Attach the evaporator to the firewall by the blower motor bracket with a 1/4" X 20 X 1/2" bolt and nut. Using the rear evaporator bracket as a guide mark and drill thru the 1/4" hole in the bracket. Attach this bracket to the firewall with a 1/4" X 20 X 1/2" bolt. This will locate the evaporator horizontally. Now secure the front evaporator support strap to the unit with the 1/4" X 20 X 1/2" bolt furnished. This support bracket will attach to the dash mount header. With the unit held in place and level, mark thru the 1/4" hole at the top of the bracket. Make sure that the spot marked will provide a good mounting location for this bracket, drill 1/4" hole. Secure the mount strap to the cowl header as shown in figure 2 with a 1/4" bolt.

   NOTE: The vents that are being used should be in place at this time.

6. The duct hose should be put on the evaporator at this point and run to the ducts to insure proper clearance.

7. Fit and cut your duct hose to length at this time.

8. Place duct hose that you have cut to length on the evaporator duct hose adapters before you finally install the unit into the car. (Figure 1)
9. Install and tighten evaporator fittings with hose attached to the evaporator. Place the evaporator on a work bench and tighten each connection with two wrenches, one on the fitting and one on the counterpart fitting attached to the evaporator. (Figure 3)

![Figure 3]

10. Check to insure that the thermostat capillary tube is in the coil fully. With the refrigeration hoses and duct hoses on the unit, lift it into place. Make sure that the firewall fittings are accessible with the unit in place. If not, tighten all refrigeration fittings inside the car now while you can reach them. Lift the unit into place and tighten the bracket bolts to secure the evaporator.

11. Run refrigeration lines. (Refer to Hose Routing Instructions.)

12. Leak check your system at this time if possible! It will be easier to correct a leak if you find it now before the car is back together. Refer to leak check instructions.

13. With your unit in place, stretch the duct hose tightly to the dash vent and recheck the length. Trim to insure that the hose is pulled tightly with a minimum of kinks or sharp bends in the hose. This will insure maximum air flow.

14. Make electrical and vacuum connection according to the diagrams furnished.

NOTE: The blue 12GA wire with the circuit breaker should be run to power source of at least 12GA wire. Connect molding plug with the (red, yellow, orange) wires to the corresponding plug from the blower motor. The red wire from the blower motor with the black extension and ring terminal must be grounded. The blue and yellow wires from the blower motor must be plugged together. The black clutch wire runs from the thermostat on the unit thru the firewall and to the black wire on the compressor. Be careful to insure that this wire is not pinched or in a position to rub on a sharp edge as it goes thru the firewall. A vacuum accumulator with check valve will help system work under a variety of conditions, including engine off. (Ford Dealer parts)

15. Center outlet: You may use center panel furnished or you can mount the vents in dash. If you use the control panel the top mounting lip should be back 1/4" to 1/2" from lower leading edge of dash. (Figure 1)
REFRIGERATION HOSE ROUTING INSTRUCTIONS (31300–VUD)

Every street rod is a little different depending on the:
1. Type of car/engine and location of engine.
2. Type of air conditioning equipment used.
3. Owners preferences.

There are many other factors that go into making each air conditioning installation different. Usually all of the above decisions are made before any consideration is given to the air conditioner installation. The air conditioner is then installed around everything.

PLANNING YOUR HOSE ROUTING:

1. Mount the major components on your car.
   a) The compressor.
   b) The condenser.
   c) Evaporator—(NOTE: The evaporator is mounted in place for hose routing, but must be removed and placed on a work bench to tighten the evaporator hose fittings. Two wrenches must be used to tighten the fittings on the evaporator. One on the fitting and one on the counterpart fitting attached to the evaporator.

NOTES:

a) While you are making these lines, determine how they will be held in place (clamps, brackets, etc.), you should run exactly like they will be when finished before you cut them to length.

b) When the hoses are made, remove them and lube all O-rings and fitting seats with refrigeration oil before final tightening.

c) Have a professional air conditioning technician leak-check and service your air conditioner.

d) It is a good idea to leave the radiator shelf off until the system is leak-checked in case resealing is necessary.

2. After all the components are mounted, remove the hose cover from the evaporator unit. Push the 5/16" hose onto fitting (3) and screw it loosely to the expansion valve. Push the 1/2" hose onto fitting (13) screw it loosely to the large threaded fittings coming out of the evaporator.

3. At this time, try to determine where you want your lines to go thru the firewall. Move hoses to that point. Hold the fittings (6) and (14) up to their respective hoses and determine if the hose will conform to the location for the bulkhead fittings (1) and (2) or bulkhead plate (Vintage Air Part #01330–VUQ). The 1/2" hose is hard to bend at sharp angles and the fittings take up a certain amount of space. So before you drill holes in your firewall make sure that you can make the hoses fit what you have planned. The engine compartment appearance is a consideration when choosing this location.

WHEN YOU HAVE DECIDED WHERE YOU WANT TO PLACE YOUR BULKHEAD FITTINGS:

4. Mark these points with a grease pencil and make a template from the inside locating where the holes will be cut. With this template, locate the same points on the outside of the firewall. Mark these points with a grease pencil.

5. With fitting (1) location determined, hold fitting (6) to the drier to determine the best location for the drier that will allow adequate room for the hose and fittings that connect the drier to the bulkhead fitting.

6. Mount the drier. (Keep the drier capped as much as possible, if you must screw the fitting to the drier, tape it closed.)

NOTE: The drier is usually mounted wherever you have room for it. Just remember to mount it in the coolest spot possible and vertically so the sight glass is directly on top. (Not next to the exhaust manifold). Inside the car is okay!

7. If all looks okay, at this point, cut holes for bulkhead fittings and install them.
